How Cubic Roots Are Defined Algebraically

From the Greek studies of the line, square, and cube came an understanding of simply, doubly, and triply extended self-similar action. For example, the triply extended action of a cube necessitates two means between the extremes. This gives an idea of cubic roots (**Figure 1**).

It is easy enough for us to retrospectively apply the symbols x , x^2 , x^3 to lines, squares, and cubes, respectively. But to what geometry do x^4 , x^5 , etc., correspond? (**Figure 2**)

FIGURE 1

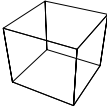

FIGURE 2

x	x^2	x^3	x^4
—			?

One solution to this paradox (preferred by petulantly childish formal mathematicians) is shown in **Figure 3**:

FIGURE 3

x	x^2	x^3	x^4

Ah, what a relief—with that pesky geometry out of the way, we can enjoy the unfettered freedom of manipulating symbols with assumed self-evident properties! We can simply recognize that x^3 means $x \times x \times x$; no troubles here! We can add and subtract too! $5-3 = 2$. And if we wanted $2-6$, we'd get -4 . Hmm, that's a new type of number I did not mean to make with my self-evident numbers, but what of it?

Continuing, we can make equations: like $x^2 = 4$, which we can solve with $x = 2$,

and also our “negative” number $x = -2$. We could even say $x^2 + 4 = 0$, which has as its answer. . . Well, let's see. . . Using the rules of algebra, $x^2 = -4$, but what on earth squared is -4 ? Both 2^2 and $(-2)^2$ are $+4$, not -4 . Well, even if it makes no sense, we can use our rule to take the square root of both sides and get $x = \sqrt{-4}$. Now, this corresponds to no real magnitude, but, who cares? Let's use it anyway!

In fact, looking at $x^3 = 8$, we get no less than three solutions, only one of which even makes sense: 2 , $-1 + \sqrt{-3}$, and $-1 - \sqrt{-3}$! Where are these strange numbers coming from? What is the source of these foreign intrusions into *my* view of the universe? Don't I have the personal right to look at things from my own point of view?
